

CNMI Department of Commerce
Central Statistics Division
February 2016

## Foreword / Acknowledgement

This paper was written by Dr. Michael J. Levin, East West Center Pacific Islands Development Program, July 2015 for the Central Statistics Division, CNMI Department of Commerce, led by Mr. Alfonis M. Sound, Special Assistant to the Secretary and Acting Director, under the general guidance of Mr. Mark O. Rabauliman, Secretary of Commerce.

Mr. Justin H. Andrew supervised the survey operation from data collection, data cleaning, and data compiling with the assistance of Wilhelm Maui (Data Talks, Inc.). Phil Bright, GIS (Geographic Information System) Specialist - Statistics for Development Division under the Secretariat of the Pacific Community - provided assistance on all GIS related to enable a registry of housing units with GPS mapping points and further allows data to be displayed on online maps (PopGIS). Dr. Levin assisted with the table sets, tabulations, analysis of compiled data from 2011 to 2014, and the write up of this report. Mr. Tom Torres assisted on data entry systems setup and other IT aspects of the project. Administrative officers Ms. Brenda Rideb and Mr. Vincent Sablan handled the day to day administrative works. Field operation would not have been possible without the efforts of the enumerators and data entry clerks.

A special thank you also goes to Mr. Ivan A. Blanco and his team at the CNMI Grants Office and to our colleagues at the US Department of Commerce for their efforts in coordinating and managing the grant requirements under the National Telecommunication and Information Administration (NTIA) funding of $\$ 1.2$ million for the CNMI. "Launched in 2009, NTIA's State Broadband Initiative (SBI) implements the joint purposes of the Recovery Act and Broadband Data Improvement Act....to facilitate the integration of broadband and information technology into state and local economies. Economic development, energy efficiency, and advances in education and healthcare rely not only on broadband infrastructure, but also on the knowledge and tools to leverage that infrastructure."

Special thanks to the island respondents of Saipan, Tinian and Rota who took part in the survey and provided valuable information used in this publication. I also want to recognize the efforts of our Resident Commerce staff on Rota and Tinian for their continued support and assistance on this project. We hope the results of this survey can be used to aid you for decision making purposes.

For more information regarding data in this report, please contact the Central Statistics Office, Capitol Hill, Saipan at (670)664-3045 or e-mail info@commerce.gov.mp.

## Introduction

The 2014 CNMI Broadband Survey showed change in broadband use on Saipan, Tinian, and Rota between 2011 and 2014. The results of the two surveys have been released. The Central Statistics Division of the CNMI Department of Commerce added additional elements to the 2011 survey questionnaire in developing the 2014 questionnaire. Because CNMI had not had a labor force survey since the 2010 Census, and since the broadband survey was large enough to avoid major sampling issues, staff added educational attainment and labor force participation for each household member in order to get additional information about the labor force situation on the three islands. The results are presented here.

## Some History

The original State Broadband Initiative (SBI) was a part of the American Recovery and Reinvestment Act (ARRA), which is more commonly referred to as the -Stimulus ${ }^{2}$. The SBI's goal was to create a comprehensive broadband map that covered every state and territory in the United States. The uses of the map are manifold: as a tool for consumers, a centralized compilation of information for the federal and state governments to use in matters of regulation and public policy, and as a trove of data for think tanks and research institutions.

In addition to the mapping aspect of the SBI, there was also a planning component. The goal of the planning section was to create a comprehensive plan to understand the extent of broadband usage and ownership, barriers to adoption, and to create a plan to overcome these barriers and to boost broadband usage through work with nonprofits, local governmental agencies, and public policy advocacy.

For the initial survey in 2011, One Global Economy was selected by the Commonwealth of the Northern Mariana Islands (CNMI) Department of Commerce to fulfill the broadband mapping grant that was awarded to them by the National Telecommunications and Information Administration (NTIA). One Global Economy is a global nonprofit community development organization whose goal it is to help low-income people gain greater access to and utility from broadband Internet connections.

One Global Economy's final deliverable was a comprehensive report that will assess the current state of broadband in CNMI by determining how fast the connections are, what proportion of the population has access to broadband, what proportion of the population subscribes to broadband; identifying the most common barriers to broadband adoption and use; and creating a blueprint towards greater broadband usage with recommendations for the local governments of the three most populated islands: Saipan, Rota, and Tinian, the federal government, local NGOs, local Internet service providers, and the people of CNMI.

[^1]The first step in this process was to draw upon the information and maps that the local telecom providers had to share with the entities undertaking the mapping project. These maps showed the approximate reach of where each telecom can offer service, what the maximum advertised upload and download speeds are, and what type of service they offer-DSL or cable, for example. These maps gave us a rough lay of the land and provided us with a good jumping off point for further research.

Using these maps information as a starting point, and drawing upon the knowledge of a local liaison, we were able to hold a series of 14 community meetings and focus groups. The main purpose of these meetings was to help us customize the NTIA's community broadband survey to make it locally relevant, culturally sensitive, and provide us with more detail about the experience of going online for the people of CNMI. For instance, knowing that many young people in CNMI get online at the Mobil Station in Garapan helps get a better understanding of the role of unsecured wireless networks in public places in the online ecosystem of Saipan.

## 2011 METHODOLOGY

In 2011, One Global Economy created a survey aimed at understanding factors that influenced broadband access and use based on community input from a series of town hall meetings conducted in local areas throughout the Northern Marianas Islands (CNMI). One Global Economy contracted with JSB Consulting, a locally based survey firm to carry out the survey. JSB Consulting collected the data using recruited enumerators. These local surveyors conducted the surveys in person, in respondents' homes, by asking respondents questions in the respondents' preferred language.

Respondents were selected to be representative of the population of CNMI, which consists of three main islands: Saipan, Tinian, and Rota. JSB Consulting (JSBC), as required under its contract with One Global Economy, selected a total of 867 Household (respondents) on Saipan, 100 on Tinian, and 100 on Rota, for grand total of 1,067 respondents. Although the task order under the contract calls for 1000 respondents, JSBC selected and additional 67 household (respondents) for Saipan to ensure that all areas on the island of Saipan are covered/represented. Selected sample dwellings that appeared vacant (upon survey period) were substituted with another occupied dwelling unit from the listing.

On the island of Saipan, a stratified sampling approach ensured that respondents proportionally represented the geographic distribution of the island's population. JSBC drew the samples by using the geographic boundaries assignments areas (AAs) and the block numbers within the AAs. The AAs and block numbers are the geographic numbers assigned by the U.S. Census Bureau and used in Censuses and Survey operations in the CNMI.

The Central Statistics Division has retained and maintained the same geographic structure since its inception. On Saipan a total of 328 assignment areas (AAs) out of 497 AAs were drawn. From these selected AAs, JSBC then randomly selected specific dwelling units in accordance with the population of those AAs. More dwelling units were drawn from AAs with larger populations, and fewer were drawn from those with smaller populations. Once a dwelling unit was drawn, it was then assigned to the field staff for enumeration.

On Rota and Tinian where only 100 sample subjects on each island were needed, the collections methodology was a straight forward random sample. Since each island has only a little over 600 hundred dwelling units, approximately 1 out of every 6 dwelling units was selected for inclusion in the sample. Tinian and Rota each have only two main villages; on each island, 50 respondents from these main villages were selected for the sample. The collection method used was the "keep right" approach, using the AA and block maps. The "Keep Right" approach is one is working on a block (the smallest geographic unit in data collection boundary) the enumerator/survey takers keep themselves on the right side of the road/boundary from any designated starting point. This prevents any selected house from being missed or going out of the designated boundary. This approach was used to ensure that the field staff does not cross over a certain boundary to cause a problem or any confusion in the process.

With each survey, surveyors noted the location of the respondent's dwelling according to the designated geographic areas. While respondents were also asked to say where they lived, this official designation allowed for more uniform aggregation of the data according to legal boundaries.

The enumerators collected the data at the selected housing units. Coders then coded certain items, and CSD office staff entered the data. For 2011, One Global Economy analyzed the data using SPSS, performing logistic and linear multivariate regression analyses, bivariate correlations, and cross-tabulations to better understand the patterns in the data and the relationships between key variables. Cross-tabulations and bivariate correlations showed the overall distribution of the population in relation to certain factors, and also the general relationship between different variables. Multivariate regression analyses were also used to determine the relationships between relevant variables after controlling for (holding constant) other related factors, and also to assess the statistical significance of these relationships. For example, simple correlations may show that additional years of education and higher income are each directly correlated with broadband adoption in the home. However, since more education and higher income are themselves often related, it is difficult to tell whether it is income or education that plays a more significant role in determining whether a household adopts broadband. A multivariate regression analysis can show whether income or education has a larger and more significant impact on broadband adoption.

The One Global Economy group concluded:

> CNMI has high rates of poverty and the closing of garment factories combined with the Japanese earthquake and tsunami of 2011 have contributed to high unemployment and emigration due to decline in all economic sectors. Against this backdrop of a shrinking population and economy, the high cost of Internet is prohibitive for many households. These households may turn to using Internet connections from nearby businesses or neighbors, perhaps without their consent. Yet reliance on a neighbor's broadband connection itself is likely not the primary cause of the low rates of broadband at home; rather, it is an effect of the high cost of Internet subscription and the inability of many residents to pay. Residents have a high desire for the Internet; they want to subscribe, they realize the benefits of the Internet, and they even have the hardware needed to access it. There is ample latent demand for broadband; however, the inability of the two ISPs to deliver high-speed Internet at affordable rates depresses residential broadband adoption. It is our opinion that additional competition for last mile connection will lower the cost to end users.

## 2014 SURVEY

The 2014 Broadband Survey was developed to see change from 2011. Most of the questionnaire was the same as the previous one. However, because the CNMI had not had a labor force survey since the 2010 census, CSD decided to add additional variables to assess the current labor force situation. And, in order to obtain sufficient households for labor force participation and unemployment, the sample size was about 4 times as large as the 2011 sample. Also, since the 2011 questionnaire took up many pages, slowing coding and keying, the questionnaire was tightened both for easy of collection, coding and keying, and also to have it conform to regular CSD conventions in questionnaire design.

Hence, the front page contained the geographic identifiers. Then the roster of household members included all members, their relationship to the head, sex, age, educational attainment, and labor force participation. After that, the person selected for the broadband questions followed on the backside of the questionnaire. Only one person was selected for the broadband items.

As in 2011, all residents of CNMI inhabit the three southern islands of Saipan, Tinian, and Rota. The northern islands were once inhabited but have been evacuated due to seismic and volcanic activity (although recently a few people have returned to at least one of them). In 2014, 1,542 surveys were conducted in total, 1,184 with residents of Saipan, 154 with residents of Tinian, and 204 with residents of Rota. Within these units, Saipan had 3,707 people, Tinian had 547, and Rota had 589.

## WEIGHTING

In order to obtain figures that resembled census numbers, the CSD staff decided to weight the individuals in the sample on the basis of their age and sex. CSD decided that the current population - the population in mid-2014 - was about the same size and structure as the 2010 population of about 54,000 . So, staff made two matrices, one 5 -year age groups by sex from the Census, and the other 5 -year age groups by sex in the broadband survey. Then, each of the census cells was divided by the sample cell to obtain a weight. These weights were then added to the records using a CSPro edit program.

When staff started making tables, however, they found that the numbers for Tinian and Rota were too high compared to those of Saipan. Hence, a new series of weights was developed as above, but also using the island of residence as the third variable. When those weights were used, the census population could be duplicated for those three variables. The tables became comparable with the 2010 census results.

Figure 1 shows the population pyramid for the broadband survey using the unweighted data. It is immediately obvious that this is not a traditional pyramid, where each age as you go up is smaller than the previous one because of mortality. CNMI has had a very large amount of migration over the last 30 years.

First, the Commonwealth experienced a very large influx of garment workers when the garment factories were established and filled with many Asian workers. Then, when the U.S. changed its policy concerning fabric entry into the U.S., the garment factories closed, and many of the immigrants left for home. However, the pyramid continues to have a very strange shape, with many young people - those under 20 years old - and very few people between 20 and 34 - and then a large bulge around 50 to 54 , followed by a decline into old age.

Part of the large bulge is the many Filipinos who came for a better life in the United States, some for construction, some to work in the garment industry, and stayed after the garment industry decreased.

Figure 1. Broadband Sample Population, CNMI: 2014

Figure 2 shows the weighted pyramid. The total represents the 54,000 people who were in the Commonwealth at the time of the 2010 Census, and assumes that the total is the same. While the weighted pyramid is slightly different because of the difference in the two populations, the structure is about the same, with very few young adults.

Figure 2. Weighted Broadband Sample Population, CNMI: 2014

Table 1 shows the numbers and percent high school graduates and college graduates (inflated by the weights). The base is the population 18 years and over. Of the 37,000 residents 18 years and over, about 6,000 had less than a high school education, about 26,000 ( 83 percent) were high school graduates, and about 13 percent were college graduates. (The high school graduates also include the college graduates)

The percent of high school graduates on Saipan was about the same as the total since most of CNMI's population lives on Saipan. More than 90 percent of the adults on Tinian and Rota were high school graduates, but their percentages of college graduates were lower than for Saipan. The percentages for males and females were close to those seen for the total population.

| Education | Numbers |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Source: 2014 CNMI Broadband Survey

Figure 3 shows the percent high school and college graduates graphically.

More people in the CNMI spoke English at home than any other language. Chamorro and Carolinian combined became the second most common languages spoken at home, followed by Tagalog. Together, these languages accounted for more than 4 in every 5 language speakers (Figure 4).

Tinian had the greater percentage of English language speakers, while Rota had the largest percentage of Chamorro speakers in the survey. Tagalog was spoken by about 20 percent of Saipan's population, and more people on Tinian spoke Tagalog than spoke Chamorro (Figure 5). About 2 in every 5 CNMI residents spoke English at home.

The item used to obtain the labor participation rates was the same one as used in the 2011 survey, and was non-standard. The choices were: (1) Employed full-time, (2) Employed parttime, (3) Student and not employed, (4) Student and employed, (5) Retired, (6) Not employed, not looking for work, (7) Not employed, looking for work, (8) Caregiver, unpaid, and (9) Other. It was assumed that "other" household members were not working for pay. It was assumed that no one was in the military since the survey did not have a category for that. In order to obtain the regular categories, the employed full time, employed part-time, and "student and employed" were combined as "employed"; the category "not employed, looking for work" supplied the "unemployed"; and all other categories were considered "Not in the labor force".

Using these categories, about 72 percent of the adults in the sample were in the labor force (Table 2). About 77 percent of the males were in the labor force compared to only 67 percent of the females. So while 3 of every 4 males were working for pay, this was true for only 2 out of every 3 females.

| Employment | Total |  |  | Saipan |  |  | Tinian |  |  | Rota |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Unemployed | 4,637 | 2,107 | 2,530 | 4,150 | 1,919 | 2,231 | 205 | 79 | 126 | 282 | 109 | 173 |
| Percent | $\begin{array}{r} 16.6 \\ 10,90 \end{array}$ | 13.6 | 20.3 | 16.6 | 13.8 | 20.1 | 13.1 | 9.7 | 16.8 | 21.3 | 14.8 | 29.5 |
| Not in the labor force | 3 | 4,520 | 6,384 | 9,841 | 4,034 | 5,807 | 557 | 244 | 313 | 505 | 242 | 264 |

As would be expected, the results for Saipan were similar to those for the whole Commonwealth, with 78 percent of the males and 66 percent of the females in the labor force (Figure 6).
However, while the percentages of males in the labor force on Rota and Tinian were about the
same as for Saipan, the percentages of females in the labor force were higher on Tinian and Rota than on Saipan.

But, while Rota had a higher percentage of females in the labor force, it also had a much higher unemployment rate. That is, while about 7 out of every 10 adult females on Rota was either working or wanting to work, about 3 in every 10 of those was actually looking for work. The percentage unemployed for the whole Commonwealth was about 17 percent - or 1 in 6 - of all those in the labor force (either paid or looking for paid work.) The percentage unemployed for males was lower than for females - more than 1 in every 5 females in the commonwealth who wanted to work could not get a paid job (Figure 7). The percentages for Saipan were similar to those of the CNMI because the majority of the population lives on Saipan. For Tinian, the rates unemployed were lower than for the other islands, perhaps because of work at the casino hotel.

Figure 7. Unemployment Rates by Sex and Island, CNMI: 2014

Peak labor force participation is in the age group 30 to 44 years. About 9 in every 10 males and 8 in 10 females in this age group were in the labor force (Figure 8). Only about 6 in 10 of the 15 to 29 year old males were in the labor force compared to about half of the females. Of course, some of these young people are still in school but they should not be part of the labor force and so should not change the results. Older people - those 45 years and over - are less likely to be in the labor force, with those 60 and over least likely to be in the labor force.

Figure 8. Labor Force Participation by Age and Sex, CNMI: 2014

As would be expected, young adults are the most likely to be unemployed. About 1 in 3 of the females and slightly less of the males 15 to 29 years old were unemployed (Figure 9). The percentages decreased with age, but leveled off for those 45 years and over.

Figure 10 shows the percent in the labor force by ethnicity and sex. As expected, a larger percentage of males than females were in the labor force at the time of the survey in 2014. About 72 percent of the total adult sample was in the labor force, with 83 percent of the Filipinos, compared to 65 percent of the Chamorros and Carolinians and 68 percent of all other ethnicities. The difference between male and female Filipinos and Chamorros/Carolinians was about 10 percentage points, but that difference was 15 points for other ethnicities.

About 1 in every 4 Chamorro and Carolinian workers was unemployed in 2014 - adults who wanted to be in paid work but could not find any (Figure 11). The percentage was smaller for males, but about 3 in every 10 female potential workers were in this category. The percentages unemployed for Filipinos were much lower - only 4 percent of the males and 11 percent of the females. And, the percentages for those of other ethnicities were still fairly high - about 1 in every 6 "other" ethnicity workers, again with males less likely than females to be unemployed.

Because Filipinos were more likely than other groups to be in the labor force, they were also more likely to speak Tagalog or other Philippines' languages, so fall in the "other" language category. About 85 percent of those speaking a language other than English, Chamorro, or Carolinian were in the labor force, with almost 9 in 10 of the males and 8 in 10 of the females (Figure 12). The percentages for English speakers were lower - about 7 in every 10 English speaking adults were in the labor force compared to about 6 in 10 of the Chamorro and Carolinian speakers. In each case, males were more likely than females to be in the labor force.

About 1 in every 6 English speaking workers were unemployed compared to about 3 in every 10 of the Chamorro/Carolinian speakers and 1 in 15 of the "Other" language speakers (Figure 13). About 1 in 3 of Chamorro and Carolinian speaking females would have liked to be in the paid labor force but could not get jobs compared to about 1 in 4 of the males.

As would be expected, adults were less education with less likely to be in the labor force than those with more education. Figure 14 shows the upward trend with those with more education more likely to be in the labor force. While about 2 in every 5 of those with less the high school
diploma were in the labor force, about 3 in 4 of those with a high school diploma and 85 percent of those with at least some college were in the labor force. In each case, the percentages for males were higher than for females. About half of the males with less than a high school education were in the labor force compared to about 1 in 3 of the females. But about 2 in every 3 females with a high school diploma and about 4 in 5 of the females with at least some college were in this category.

Figure 14. Labor Force Participation by Education, CNMI: 2014

And, we see a direct relationship between education and less unemployment. Only 7 percent of the adults with at least some college were unemployed in 2014 compared to 20 percent of those with a high school diploma, and 38 percent of those with less than a high school diploma (Figure 15). In fact, almost half of the females with less than a high school education were unemployed, and 1 in 4 of those with a high school diploma. About 1 in 10 of the females with at least some college was unemployed compared to about 1 in 20 of the males.

Figure 16 shows labor force participation for three income categories - households with less than $\$ 15,000$ in annual income, those with between $\$ 15,000$ and $\$ 30,000$ and those with $\$ 30,000$ or more. As the figure shows, labor force participation only increased a small amount with rising income. About 2 out of every 3 adults in households earning less than $\$ 15,000$ per year were in the labor force compared to about 3 in 4 of those in households earning $\$ 30,000$ or more per year. As usual, males were more likely to be in the labor force than females at each income level, with males showing a less steep series than the females.

But, unemployment for those in households making less than $\$ 15,000$ was much higher than for those in households making $\$ 15,000$ per year or more (Figure 17). This is expected because households with fewer workers are likely to be poorer. About 4 in 10 of adult females in paid employment living in households making less than $\$ 15,000$ were unemployed compared to about 1 in 6 of those in households making between $\$ 15,000$ and $\$ 29,999$, and 1 in 12 of those making $\$ 30,000$ or more. The combined sexes also showed steep declines.

## CHARACTERISTICS OF BROADBAND USE IN 2014 BY ISLAND

This section of the report will look at characteristics of households with and without Broadband internet. A final section will look at the characteristics of individuals within the households, but here we will be looking only at the whole household at once.
Table 3 shows the 1,542 households in the survey having characteristics of those who responded to the broadband questions. About 4 out of every 5 households had some kind of computer. Desktops were most common in Tinian, at 7 of 10 households, compared to about 6 of every 10 households on the other two islands. Desktops were about 3 of every 5 households in this part of the sample, Handhelds were about 1 in 5 , and those with no computers were most of the rest.

| Own Computer | Number |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | Saipan | Tinian | Rota | Total | Saipan | Tinian | Rota |
| Total | 1,542 | 1,184 | 154 | 204 | 100.0 | 100.0 | 100.0 | 100.0 |
| Desktop laptop | 919 | 685 | 108 | 126 | 59.6 | 57.9 | 70.1 | 61.8 |
| Handheld | 291 | 237 | 26 | 28 | 18.9 | 20.0 | 16.9 | 13.7 |
| Other | 2 | 1 | 1 | 0 | 0.1 | 0.1 | 0.6 | 0.0 |

At least one person in about 3 in every 4 households in the sample used the internet. The percentages were about the same for each of the three islands (Table 4). Hence, internet use was extremely frequent in the CNMI in 2014.

| Using Internet at all | Number |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Source: 2014 CNMI Broadband Survey
More than half - in fact 58 percent - of all the households that had at least one person using the internet ( 1,146 of the 1,542 total households in the sample) used the internet "several times a day"(Table 5). About 3 in 10 used the internet either once a day or 3 to 5 times a week. Only about 1 in 10 households used the internet less frequently.

| Frequency using Internet | Number |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | Saipan | Tinian | Rota | Total | Saipan | Tinian | Rota |

Of the households in the sample, about 4 in every 5 had at least one member who used the internet (Table 6). The percentages were about the same for each of the islands.

| Anyone at home using Internet | Number |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| No users | 295 | 221 | 28 | 46 | 19.1 | 18.7 | 18.2 | 22.5 |

Source: 2014 CNMI Broadband Survey
The number of household members who used the internet was also similar for the islands. While about 50 of the households had 6 or more members using the internet, almost 300 had no internet users (Table 7). The median number of users was 2.3 household members, with Tinian being slightly higher and Rota a little lower.

Table 7. Number of household Internet Users by Island, CNMI: 2014

| Number of household users | Number |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Of the 816 broadband households, about half had speeds of 1.5 to 3 MBPS , and another 1 in 3 had speeds of 200 to 768 KBPS (Table 10). Saipan was the most likely to have speeds of 1.5 to 3 MBPS, compared to 200 to 768 KBPS on Tinian.

| Service Speed of Internet | Number |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | Saipan | Tinian | Rota | Total | Saipan | Tinian | Rota |

Of the 726 households that did not have broadband in the survey, the largest number - 430 or 59 percent - said they did not have broadband because it was "too expensive" (Table 12). About 1 in 3 claimed they "did not need broadband" and about 1 in 4 gave "other reasons". The percentages sum to more than 100 percent because respondents could pick more than one reasons. The largest percentage of those claiming broadband was too expensive lived on Saipan.

| Main Reasons No Broadband | Number |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Other reason | 183 | 138 | 20 | 25 | 25.2 | 24.3 | 32.3 | 26.3 |

Source: 2014 CNMI Broadband Survey
Note: Percents sum to more than 100 because of multiple selections
Table 13 shows that 464 of the 726 households ( 64 percent) of those who did not have broadband claimed they did not have it because of the prohibitive monthly cost (Table 13). The
next largest complaint was the cost of installing the broadband, followed by the cost of a computer itself, and cost of electricity. Again, the percentages add to more than 100 percent because households could select more than one. About 7 in 10 of the households without broadband on Saipan claimed "monthly cost" as the biggest deterrent.

Table 13. Prohibitive Costs Against Broadband Use by Island, CNMI: 2014

| Prohibitive Costs | Numbers |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note: Percents sum to more than 100 because of multiple selections

The average household respondent was willing to pay about $\$ 24$ for internet use, with those already having broadband suggesting about $\$ 28$ and those without broadband saying about $\$ 20$ (Table 14 and Figure 18). Tinian users were willing to pay the most, at $\$ 33$ ( $\$ 38$ for those with broadband, $\$ 27$ for those without. Saipan users offered the least at $\$ 22$ ( $\$ 27$ for those with broadband, and $\$ 17$ for those without.

| Amount willing to pay | Total |  |  | Saipan |  |  | Tinian |  |  | Rota |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

By contrast, of the 816 current broadband users in 2014, the average monthly cost, according to their reports, was about $\$ 59$ (Table 15). Tinian had the highest monthly cost, at about $\$ 71$, followed by Rota (at \$67) and Saipan (\$57). About 1 in every 6 broadband households paid $\$ 100$ or more for their service.

| Monthly Payment | Numbers |  |  |  | Percents |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 16 and Figure 19 show access to internet outside the home. For all households, the largest percentage used the internet at work (almost half), followed by in restaurants ( 36 percent), and several other places. Those with broadband service at home were even more likely to check the internet work - almost 3 in every 5 - and in a restaurant (somewhat less than half). For those without broadband service at home, the percentages using internet outside the home were generally lower. Broadband users on Tinian were the most likely to check the internet at work about 72 percent), while only 48 percent of Rota broadband users checked the internet at work.

Figure 20. Importance of Broadband, CNMI: 2014

As noted, about 1,247 of the 1,542 households in the sample actually had a computer. Of those, more were satisfied with their connection speed than were not, more were not satisfied with their cost of service than were satisfied, about half were satisfied with the "ease of use", and more were satisfied with the reliability than were not satisfied (Table 18).

| Cost Most Concerned | Total |  |  | Saipan |  |  | Tinian |  |  | Rota |  |  |

Source: 2014 CNMI Broadband Survey

Finally, Table 19 and Figure 21 show the household income distribution and the median household income for the sample households. The median family income for those who reported their income was about $\$ 20,000$. Households with broadband had a median household income of about $\$ 25,000$, almost double the $\$ 13,000$ for those households without broadband. Household median income was highest on Tinian, at $\$ 29,000$ ( $\$ 37,500$ for those with broadband, $\$ 18,000$ for those without broadband, compared to $\$ 22,000$ on $\operatorname{Rota}$ ( $\$ 26,000$ for those with broadband, $\$ 17,000$ without), and Saipan ( $\$ 19,000$, with $\$ 24,000$ for those with Broadband, and $\$ 12,000$ for those without.) In general, households with broadband had household incomes about twice that of those without broadband.

| Island Broadband | Total | Providing Household Income |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Total | $\begin{array}{r} \text { Less than } \\ \$ 15,000 \end{array}$ | $\begin{array}{r} \$ 15,000 \text { to } \\ \$ 29,999 \\ \hline \end{array}$ | $\begin{gathered} \$ 30,000 \\ \& \text { over } \\ \hline \end{gathered}$ | Median |
| Total | 1,542 | 1,517 | 610 | 457 | 450 | \$20,218 |

Source: 2014 CNMI Broadband Survey

This section looked at use of and attitudes about broadband use in the CNMI. The populations of all three islands use the internet on a daily basis, and want the fastest, most dependable broadband internet they can get.

## 2011 to 2014 CHANGE

In the following tables, we look at the changes in a few characteristics between the 2011 and 2014 broadband surveys. Internet use increased during the 3 -year period, as would be expected (Table 20 and Figure 22). But the jump was considerable (and so the definitions of internet use may have changed.) The percentage of persons having internet at home jumped from about 68 percent in 2011 to about 87 percent in 2014.

| Table 20. Internet at Home, CNMI: 2011 and 2014 | 2011 | 2014 |  |
| :--- | ---: | ---: | ---: |
|  |  | percent | Number |

Source: 2011 and 2014 Broadband Surveys
Figure 22. Broadband use by Island, CNMI: 2011 and 2014

The 2011 Broadband survey report did not show very many of the variables separately in the report. One variable that was shown was educational attainment, as seen in Table 21 and Figure 23. Here, we find large differences between the 2011 and 2014 surveys. The percentage with some high school in 2011 was much smaller than that seen in 2014, and the other categories also reflected these differences. It is not clear why the distribution was so different in the two series.

| Education | 2011 | 2014 |  |
| :---: | :---: | :---: | :---: |
|  |  | Number | Percent |
| Total | 100 | 53,883 | 100.0 |
| Some High School | 11 | 22,364 | 41.5 |
| HS diploma | 45 | 16,595 | 30.8 |
| GED | 2 | 914 | 1.7 |
| Some College | 23 | 9,348 | 17.3 |
| BA/BS | 14 | 3,229 | 6.0 |
| Grad work | 5 | 1,433 | 2.7 |

[^2]

The labor force participation rates for the two enumerations, however, were remarkably similar. Labor force participation rates tend to vary over time depending on the current economic conditions, so these two surveys were taken under similar economic conditions. About 70 percent of the adults in 2011 were in the labor force compared to about 72 percent in 2014 (Table 22 and Figure 24). And, about 13 percent were unemployed in 2011 compared to about 12 percent in 2014.

Table 22. Labor Force Distribution, CNMI: 2011 and 2014

| Employment | 2011 | 2014 |  |
| :---: | :---: | :---: | :---: |
|  |  | Number | Percent |

| Not employed looking for work | 13 | 4,674 | 12.1 |
| Other | 3 | 1,084 | 2.8 |

## BROADBAND USE

Until this point we have been discussing general characteristics of the survey population in 2014 and the Broadband use by whole households. Since the survey was a survey of broadband use, and we have discussed what all family members were doing, the following tables discuss broadband use of the selected (random) individuals compared to other variables in the survey.

Young people in the CNMI in 2014 were very likely to use the internet, with those less than 29 making up more than 2 out of every 5 of the users (Figure 25). On the other hand, about 30 percent of those not using broadband internet were younger than 30 years. The percentage of elderly not using the internet was great than the percentage of elderly using the internet.

The age distributions for males and females for broadband use were similar. For both sexes, younger people were more likely than older people to use the internet. The youngest were most likely to use the internet and those 45 years and older were the least likely, for both sexes (Figure 26).

When looking at broadband use by island and age, we find that young people are Tinian were the most likely to use broadband internet at home, and their elderly the least likely (Figure 27). Older people on Rota were less likely to use broadband than on either of the other islands.

Figure 28 shows broadband use by educational attainment and island. Those with tertiary education were most likely to use the internet, at about 93 percent. Surprisingly, those adults with less than high school education was more likely to use the internet at home than those with
a high school diploma. This pattern was seen on each of the islands. However, while tertiary educated were the mostly likely to use the internet on Saipan and Tinian, on Rota it was those with less than a high school education who were most likely to use the internet.

The combination of Chamorros and Carolinians (the indigenous populations), Filipinos, and "Others" were the major ethnic groups enumerated in the 2014 Broadband Survey While about 86 percent of the Chamorros and Carolinians in the CNMI used broadband internet, Filipinos (at 89 percent and "others" (at 88 percent) were even more likely to use the internet (Figure 29). Chamorros and Carolinians on Tinian were more likely than those on Saipan and Rota, but Filipinos on Rota were more likely than those on Saipan and Tinian to use the internet (although by a small percentage point difference.)

While about 72 percent of the CNMI adult population was in the labor force in 2014, about the same percentage used broadband at home, while a somewhat smaller percentage did not use broadband at home (Figure 30). Similarly about the same percentage of males used broadband
as the total, while only a slightly smaller percentage did not use broadband at home. Finally, the differences for females were greater - while 66 percent of the female adult population was in the labor force, about 67 percent used broadband, while only 59 percent of those in the labor force did.

The unemployment rates differed more. Adults in the CNMI were much less likely to use broadband internet at home if they were unemployed than if they were unemployed (Figure 31). This was true for both males and females, but much truer for females, with almost half of those unemployed not using the internet.

Figure 31. Unemployment Rates by Presence of Broadband, CNMI: 2014

## CONCLUSION

The 2014 Broadband Study surveyed 1,542 households, about 10 percent of all units in the CNMI. This sample was large enough to have a fairly low sampling error. However, the question used to obtain the labor force differed from the usual question in obtaining labor force participation and unemployment; nonetheless, the rates seem reasonable.

About 72 percent of the adult population - those 16 years and over - were in the labor force, including 77 percent of the males and 67 percent of the females. About 17 percent of the adults were unemployed - about 14 percent of the males and 21 percent of the females. For the youngest potential workers, those 15 to 29 years old, about half were in the labor force, but half were not in the labor force (many of them still in school). In this age group, about 29 percent of the males and 32 percent of the females were unemployed.

By ethnicity, about 65 percent of the Chamorros and Carolinians were in the labor force, and about 26 percent of them were unemployed. For Filipinos, about 84 percent were in the labor force with 7 percent being unemployed. About 62 percent of Chamorro and Carolinian speakers were in the labor force, with 29 percent being unemployed compared to 72 percent of English speakers in the labor force and 16 percent being unemployed.

Finally, only 43 percent of those with less than a high school education were in the labor force and 38 percent unemployed, compared to 75 percent of high school graduates in the labor force and 20 percent unemployed and 85 percent of those with some college in the labor force with 7 percent being unemployed.

In summary, the labor force situation in the Commonwealth in 2014 was not particularly good, particularly for those who wanted to work but could not find jobs. An unemployment rate of 17 percent is very high by United States standards although not by Third World standards; about 1 in every 6 potential works could not find jobs. And, more than 1 in 4 of all adults were not working, some of them presumably having given up looking. These figures could bode well for economic development in the CNMI because of the potential workers for industry, but these rates would likely send many potential workers, particularly the large number of young workers to other places, like Guam, Hawaii, and the US Mainland looking for jobs in areas of less unemployment and more job prospects.

Broadband use is now expected by households in the CNMI. In 2014, more than half the households had broadband, and most of the others would have liked to have it, if it was available, and if it came at a reasonable cost. If household members did not have internet at home, most found another venue to access the outside world.
